

Educational level and salary

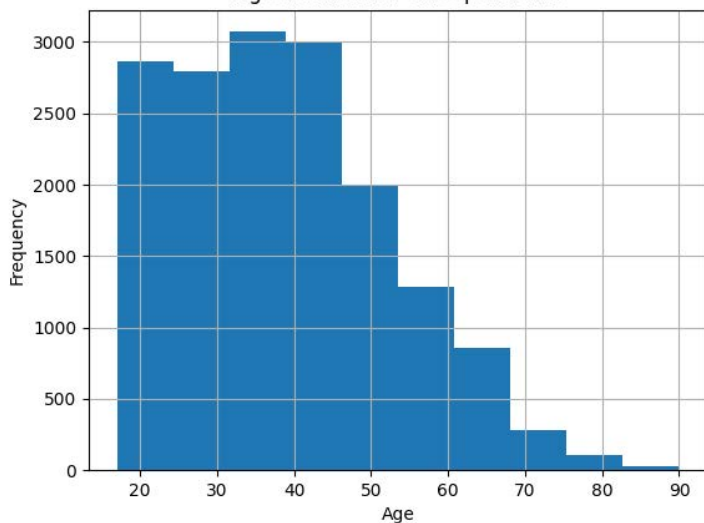

Relationship status

Categorical Data Distribution

Age distribution of respondents

From the age distribution histogram, we don't have equal data based on age and it is important since as people get older their revenue will grow one of the reasons could be job experience.

from relationships we can find out that in our dataset nearly half of the participants were married and it affects peoples' revenue for example when you are single you may not need to work as you dont need to help your partner financially.

from the educational level, we can find out that as people get higher degrees they can get higher salaries.
